

# Security Awareness Training and Testing Service

How to combat Social Engineering, Phishing and Ransomware

## Don't let your employees be the weakest link in your IT security

Infosec Cloud Security Awareness Training & Testing (SATT) is a fully managed service designed to protect IT users from today's sophisticated cyber attacks.

Delivered at the desktop, high quality, web-based interactive training is combined with frequent simulated phishing attacks, live demonstration videos and short tests to make sure employees understand the mechanisms of spam, phishing, spear phishing, malware and social engineering.

### Measurable Results

Infosec Cloud will set-up, manage and report on the service, starting with an initial simulated phishing attack to baseline your organisation. This enables you to measure the impact of the training and monitor progress.

**The service takes a short amount of employee time, is suited to organisations of all sizes and requires minimal IT team support. You will see immediate results.**

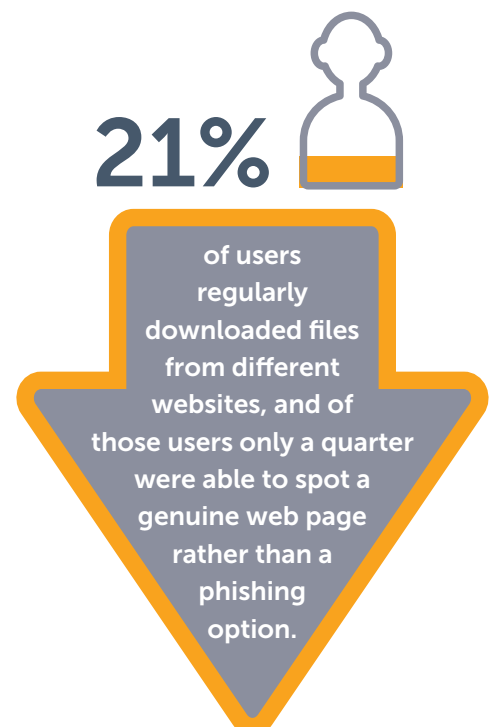

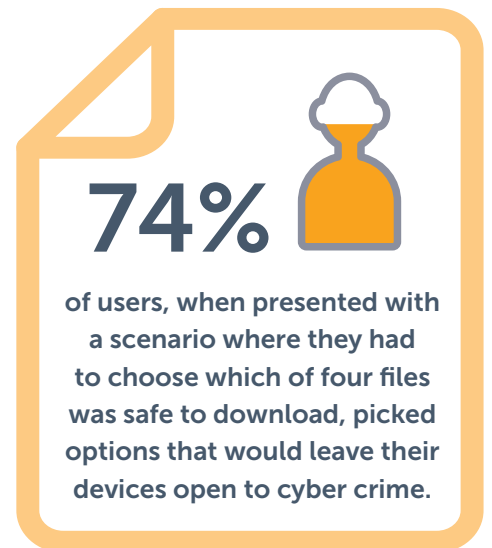

### Service Overview

**STEP 1** The service starts with a company-wide baseline Phishing Security Test which will show the percentage of your users that are Phish-prone.

**STEP 2** The next step is to provide all employees with Security Awareness Training. This is delivered at the desktop and can be started and paused as required by the user. We track who has completed the training.

**STEP 3** After the initial company-wide training, Infosec Cloud's highly effective scheduled Phishing Security Tests keep employees on their toes. Employees who fall for the attacks receive instant remedial online training.

**The service is provided as a 12 month program.**

## Proactive Managed Service

### The 12 month managed service comprises:

- Regular Phishing Security Tests - unlimited and on-demand when needed
- Security Hints & Tips
- Training videos on Security Awareness
- Additional training for users who put the organisation at security risk
- Individual user reports
- Email reports/statistics on user phishing tests
- Customised emails targeted at individuals and teams
- Scheduled and randomised emails to users
- IT Helpdesk Guide
- Full reporting to management

Plus an Email security health check (1 every 12 months)

All from Industry experts in IT Security and Training.

58%

of users named fake sites when picking websites they would readily submit their data to.

### Key Benefits

#### The service provides a number of key benefits:

Measures and reduces employee susceptibility to real-world cyber attacks

Gathers hard data by testing and tracking employee security awareness and behaviour

Delivers focused training to increase security awareness and improve behaviour

Identifies your organisation's real-world security posture

Regular testing raises employee awareness and understanding of sophisticated cyber attacks, which combined with focused training, empowers IT users to significantly reduce the risk to your organisation.

All from less than £1/user/month.

IT managers know users are the weakest link in IT security, with phishing and spear-phishing being the foremost of threats. The UK has seen a 4,000% increase of dangerous ransomware through rapid innovation by sophisticated Eastern European criminals. This puts employees in the position of inadvertently giving away the keys to the kingdom. It is more critical than ever to help users understand the consequences of their actions and learn how to combat cybercrime attacks

The Infosec Cloud fully managed Security Awareness Training and Testing service ensures your IT users are security vigilant and your organisation protected.
